

## STATES OF MATTER

There are five known phases, or states, of matter: solids, liquids, gases, and plasma and BoseEinstein condensates.
Here we will study only three. Solid, Liquid and Gas

## States of Matter

Subliming

|  | Properties | Solids | Liquids | Gases |
| :--- | :--- | :--- | :--- | :--- |
| 1 | Mass | Definite | Definite | Definite |
| 2 | Shape | Definite | Acquires the shape <br> Of the container | Acquires the shape of <br> the container |
| 3 | Volume | Definite | Definite | Indefinite |
| 4 | Compressibility | Not possible | Almost Negligible | Highly Compressible |
| 5 | Fluidity | Not possible | Can flow | Can flow |
| 6 | Rigidity | Highly rigid | Less rigid | Not rigid |
| 7 | Diffusion | Slow | Fast | Very fast |
| 8 | Space between <br> particles | Most closely <br> packed | Less closely packed | Least closely packed |
| 9 | Inter-particle force | strongest | Slightly weaker than <br> in solids | Negligible |

## GASEOUS STATE

Only eleven elements exist as gases under normal conditions

## GASEOUS STATE

The gaseous state is characterized by the following physical properties.

- Gases are highly compressible.
- Gases exert pressure equally in all directions.
- Gases have much lower density than the solids and liquids.
- The volume and the shape of gases are not fixed. These assume volume and shape of the container.
- Gases mix evenly and completely in all proportions without any mechanical aid (Diffusion)

## Gas Laws

1. Boyle's Law: At constant temperature
$\mathrm{P} \propto \frac{1}{\mathrm{~V}}$
$\mathrm{PV}=$ constant
$\mathrm{P}_{1} \mathrm{~V}_{1}=\mathrm{P}_{2} \mathrm{~V}_{2}=\mathrm{P}_{3} \mathrm{~V}_{3}=\cdots=$ constant

2. Charles Law: At constant pressure
$\mathrm{V} \propto \mathrm{T}$ or $\frac{\mathrm{V}}{\mathrm{T}}=$ constant $=\mathrm{K}$
Here K is a constant that depends on the pressure of gas, the amount of gas and also unit of volume if $\mathrm{V}_{1}$ and $\mathrm{T}_{1}$ are the initial values of volume and temperature of a gas then,
$\frac{\mathrm{V}_{1}}{\mathrm{~T}_{1}}=\mathrm{K}$
Also, if the temperature is now changed to $T_{2}$ such that the volume change to $V_{2}$
We can write,
We can write, $\frac{\mathrm{V}_{2}}{\mathrm{~T}_{2}}=\mathrm{K}$ Or $\frac{\mathrm{V}_{1}}{\mathrm{~T}_{1}}=\frac{\mathrm{V}_{2}}{\mathrm{~T}_{2}}$ or $\mathrm{V}_{1} \mathrm{~T}_{2}=\mathrm{V}_{2} \mathrm{~T}_{1}$

Volume Vs Temperature graph ( c)
3. Avogadro's Law: At constant pressure and temperature V $\propto \mathbf{n}$ (no. of moles)

## 4. Ideal gas equation

Ideal gas equation
$\left.\mathrm{V} \propto \frac{1}{\mathrm{p}}\right\}$
$V \propto T\}$
$V \propto n$
$V \propto \frac{\mathrm{nT}}{\mathrm{p}}$
$\mathrm{V}=\frac{\mathrm{nRT}}{\mathrm{p}}$
$\mathrm{P}=\frac{\mathrm{n}}{\mathrm{v}} \mathrm{RT}=\rho \mathrm{RT}$
$\mathrm{R}=$ gas constant
$\mathrm{P}=\frac{\frac{\mathrm{w}}{\mathrm{M}}}{\mathrm{V}} \mathrm{RT}$
$\mathrm{w}=$ mass of gas $\rho=$ density
$M=M o l$ weight of gas $R=$ gas constant

## 5. Modified gas equation

$\frac{\mathrm{P}_{1} \mathrm{~V}_{1}}{\mathrm{~T}_{1}}=\frac{\mathrm{P}_{2} \mathrm{~V}_{2}}{\mathrm{~T}_{2}}$
If moles are constant
$P_{1} V_{1}=P_{2} V_{2}$
If $\mathrm{n} \& \mathrm{~T}$, are constant
$\frac{\mathrm{P}_{1}}{\mathrm{~T}_{1}}=\frac{\mathrm{P}_{2}}{\mathrm{~T}_{2}}$
If $n \& V$, are constant
$\frac{\mathrm{V}_{1}}{\mathrm{~T}_{1}}=\frac{\mathrm{V}_{2}}{\mathrm{~T}_{2}}$
If $n \& P$, are constant

## Gas Constant ' $R$ '

$\mathrm{R}=\frac{\mathrm{PV}}{\mathrm{nT}}$
$=0.0821$ lit atm $/ \mathrm{K}$. mole
$=8.314 \times 10^{7} \mathrm{erg} / \mathrm{k}$. mole
$=8.314 \mathrm{~J} / \mathrm{k}$. mole
$=1.987 \mathrm{cal} / \mathrm{k}$. mole

## Units and conversion

|  | SI | cgs | Common |
| :---: | :---: | :---: | :---: |
| V | $\mathrm{m}^{3}$ | $\mathrm{~cm}^{3}$ | Liter |
| p | $\mathrm{N} / \mathrm{m}^{2}$ | Dy/cm | Atm. and mm Hg |
| T | K | K | ${ }^{\circ} \mathrm{C}$ |
| n | moles | moles | moles |

Conversion
Volume $\quad \Rightarrow \quad 1 \mathrm{~m}^{3}=10^{6} \mathrm{~cm}^{3}=10^{3}$ lit
Pressure $\quad \Rightarrow \quad 1 \mathrm{~atm}=760 \mathrm{~mm} \mathrm{Hg}=101.3 \mathrm{kPa}$
$\begin{aligned} & =1.013 \times 10^{5} \mathrm{~Pa}=14.7 \mathrm{Psi} \\ 1 \text { bar } & =10^{5} \mathrm{~Pa}=10^{6} \mathrm{dy} / \mathrm{cm}^{2}=750 \text { torr }\end{aligned}$
Temperature $\quad \Rightarrow \quad \mathrm{K} \quad={ }^{\circ} \mathrm{C}+273.15$
