## Chemical Kinetics

## Day - 1

Ex.1- Calculate the $\Delta \mathrm{G}^{\mathrm{o}}{ }_{\mathrm{rxn}}$ for the following overall reaction of the conversation of
$\mathrm{C}_{\text {diamond }} \rightarrow$ Cgraphite $\quad \Delta \mathrm{G}^{\mathrm{o}}{ }_{\mathrm{rxn}}=$ ?
$\mathrm{C}_{\text {diamond }}(\mathrm{s})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g}) \quad \Delta \mathrm{G}_{\mathrm{rxn}}^{\mathrm{o}}=-397 \mathrm{~kJ}$
$\mathrm{C}_{\text {graphite }}(\mathrm{s})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g}) \quad \Delta \mathrm{G}_{\mathrm{rxn}}^{\mathrm{o}}=-394 \mathrm{~kJ}$
(a) -3 kJ
(b) +3 kJ
(c) -791 kJ
(d) +791 kJ

Answer (a). This proves that conversion of diamond to graphite is spontaneous.
Ex. 2 - Combustion of Carbon: at 25 oC
$\mathrm{C}+\mathrm{O}_{2} \rightarrow \mathrm{CO}_{2} ; \Delta \mathrm{H}_{1}=-393.5 \mathrm{~kJ} / \mathrm{mole} \Delta \mathrm{S}=2.986 \mathrm{~J} / \mathrm{mole} / \mathrm{K}$
Find $\Delta \mathrm{G}$ for the reaction
$\Delta \mathrm{G}=\Delta \mathrm{H}-\mathrm{T} \Delta \mathrm{S}=-393.5-(298 \times 2.986) / 1000=-394.39 \mathrm{KJ} / \mathrm{mole}$
So now two questions

1. Why diamonds are called diamonds for ever
2. Why does wood and paper not catch fire on it's own

Thermodynamics tells us whether the reaction will go forward, backward or is at equilibrium. Thermodynamics does not tell us.

1. how fast or slow the reaction proceeds
2. What is the mechanism of reaction?

Chemical kinetics is the branch of chemistry, which deals with the study of reaction rates and their mechanisms.
Reaction can be classified as
A. Very fast ( $\mathrm{t}<10^{-6}$ seconds)
ex. $\mathrm{NaOH}+\mathrm{HCl} \rightarrow \mathrm{NaCl}+\mathrm{H}_{2} \mathrm{O}\left(\mathrm{t} \sim 10^{-12} \mathrm{~s}\right)$
B. Very slow
ex. C (diamond) $\rightarrow \mathrm{C}_{\text {graphite }} \quad(\mathrm{t} \sim$ million years $)$
C. Moderate In between the above two, where rates can be measured experimentally

Ex. $\quad \mathrm{NO}_{2}(\mathrm{~g})+\mathrm{CO}(\mathrm{g}) \rightarrow \mathrm{NO}(\mathrm{g})+\mathrm{CO}_{2}(\mathrm{~g})$

$$
2 \mathrm{FeCl}_{3}+6 \mathrm{KI} \rightarrow 2 \mathrm{FeI}_{2}+6 \mathrm{KCl}+\mathrm{I}_{2}
$$

## AVERAGE RATE OF REACTION

Rate $=\frac{\text { change in concentration }}{\text { change in time }}=\frac{\Delta c}{\Delta t}$
Instant Rate and Reaction is the rate a particular time $=\frac{d c}{d t}$

Units of Rate of reaction are mole/lit sec or atm/sec

## RATE OF REACTION

$\mathrm{aA}+\mathrm{bB} \rightarrow \mathrm{cC}+\mathrm{dD}$
Rate $=-\frac{1}{a} \frac{1 d(A)}{d t}=-\frac{1}{b} \frac{d(B)}{d t}=\frac{1}{c} \frac{d(c)}{d t}=\frac{1}{d} \frac{d(D)}{d t}$
Ex.1: Formation of ammonia from nitrogen and hydrogen if rate of ammonia formation is $2 \times 10^{-4}$ $\mathrm{mol} / \mathrm{lit} \mathrm{sec}$ find rate of disappearance of $\mathrm{N}_{2} \& \mathrm{H}_{2}$
$\mathrm{N}_{2}+3 \mathrm{H}_{2} \rightarrow 2 \mathrm{NH}_{3}$
Rate $=-\frac{\mathrm{d}\left[\mathrm{N}_{2}\right]}{\mathrm{dt}}=-\frac{1}{3} \frac{\mathrm{~d}\left(\mathrm{H}_{2}\right)}{\mathrm{dt}}=\frac{1}{2} \frac{\mathrm{~d}\left(\mathrm{NH}_{3}\right)}{\mathrm{dt}}$
given $\frac{\mathrm{d}\left[\mathrm{NH}_{3}\right]}{\mathrm{dt}}=2 \times 10^{-4}$
As. $\mathrm{H}_{2} \& \mathrm{~N}_{2}$ rate of disappearance is
$\frac{\mathrm{d}\left(\mathrm{N}_{2}\right)}{\mathrm{dt}}=-1 \times 10^{-4}$
$\frac{d\left(\mathrm{H}_{2}\right)}{d t}=-3 \times 10^{-4}$
$3 \times 10^{-4} \frac{\text { mole }}{\text { litsec }}$ and $\frac{10^{-4} \text { mole }}{\text { lit sec }}$

## LAW OF MASS ACTION

Law of Mass Action (Goldberg and wage 1864)
"Any given temperature the rate of reaction is proportional to the product of active masses of the power equal to their stoichiometric ratios.

$$
\begin{array}{ll}
\mathrm{aA}+\mathrm{bB} \rightarrow \text { Products } \\
\text { Rate } \propto[\mathrm{A}]^{\mathrm{a}} \text { and Rate } \propto & {[\mathrm{b}]^{\mathrm{b}}} \\
\text { Rate }=\mathrm{K}[\mathrm{~A}]^{\mathrm{a}}[\mathrm{~B}]^{\mathrm{b}} & \mathrm{~K}=\text { Rate constant. }
\end{array}
$$

The rate constant depends upon

1. Nature of reactants
2. Temperature
3. Catalyst

Unit of rate constant $(\mathrm{R})=\left(\frac{\text { lit }}{m o l}\right)^{n-1} \sec ^{-1}$
$\mathrm{n}=$ order of reaction

| RATE OF REACTION | RATE CONSTANT |
| :--- | :--- |
| Rate of reaction is the change in the <br> concentration of reactions or the <br> change in the concentration of <br> products per unit time | Rate constant is the proportionality <br> constant related to the rate of a <br> particular reaction |
| Depends on the molar concentrations <br> of reactants and products | Does not depend on the molar <br> concentrations of reactants and <br> products |
| Depends on the temperature <br> indirectly | Essentially depends on the <br> temperature |
| Depends on the time taken for the <br> reaction | Does not depend on the time taken <br> for the reaction |

## Collision theory

A chemical reaction taken place when the molecules of reaction

1. Collide with each other
2. Must possess energy greater than activation energy of the system.
3. The collisions should have proper orientation.

## 1. Collision of particles

How number of collisions change with concentration
