Questions: 1:- In an LCR circuit as shown below both switches are open initially. Now switch $\mathrm{S}_{1}$ is closed, $\mathrm{S}_{2}$ kept open. ( q is charge on the capacitor and $\tau=\mathrm{RC}$ is capacitive time constant). Which of the following statement is correct?
(A) $\mathrm{At}=\tau, \mathrm{q}=\mathrm{CV} / 2$
(B) $\operatorname{At} t=2 \tau, \mathrm{q}=\mathrm{CV}\left(1-\mathrm{e}^{-2}\right)$
(C) $\operatorname{Att}=\frac{\tau}{2}, \mathrm{q}=\mathrm{CV}\left(1-\mathrm{e}^{-1}\right)$
(D) Work done by the battery is half of the energy dissipated in the resistor.

Ans:- (B) Charge on the capacitor at any time ' $t$ ' is
$\mathrm{q}=\mathrm{CV}\left(1-\mathrm{e}^{-\mathrm{t} / \tau}\right)$
at $\mathrm{t}=2 \tau$
$\mathrm{q}=\mathrm{CV}\left(1-\mathrm{e}^{-2}\right)$
Questions: 2:- A diode detector is used to detect an amplitude modulated wave of $60 \%$ modulation by using a condenser of capacity 250 pico farad in parallel with a load resistance 100 kilo ohm. Find the maximum modulated frequency which could be detected by it.
(A) 10.62 kHz
(B) 5.31 MHz
(C) 5.31 kHz
(D) 10.62 MHz

Ans:- (C)
$\mathrm{f}_{\mathrm{C}}=\frac{1}{2 \pi \mathrm{RC}}=\frac{1}{2 \times 3.14 \times 100 \times 10^{3} \times 250 \times 10^{-12}}=6.37 \mathrm{kHz}$
$\mathrm{f}_{\mathrm{C}}=$ cut off frequency
As we know that $\mathrm{f}_{\mathrm{m}} \square \mathrm{f}_{\mathrm{C}}$
$\therefore$ (3) is correct
Note: The maximum frequency of modulation must be less than $f_{m}$, where
$\mathrm{f}_{\mathrm{m}}=\mathrm{f}_{\mathrm{C}} \frac{\sqrt{1-\mathrm{m}^{2}}}{\mathrm{~m}}$
$\mathrm{m} \Rightarrow$ modulation index
Questions: 3:- The supply voltage to a room is 120 V . The resistance of the lead wires is $6 \Omega$. A 60 W bulb is already switched on. What is the decrease of voltage across the bulb, when a 240 W heater is switched on in parallel to the bulb?
(A) 2.9 Volt
(B) 13.3 Volt
(C) 10.04 Volt
(D) zero volt

Ans:- (C)
Resistance of bulb $=\frac{120 \times 120}{60}=240 \Omega$
Resistance of Heater $=\frac{120 \times 120}{240}=60 \Omega$

Voltage across bulb before heater is switched on, $\mathrm{V}_{1}=\frac{120}{246} \times 240$
Voltage across bulb after heater is switched on, $\mathrm{V}_{2}=\frac{120}{54} \times 48$
Decrease in the voltage is $\mathrm{V}_{1}-\mathrm{V}_{2}=10.04$ (approximately)
Note: Here supply voltage is taken as rated voltage.
